2025-01-17_20-54-34 https://docs.rsshub.app/deploy/config#access-control-configurations

Access Key/Code

- `ACCESS_KEY`: the access key. When set, access via the key directly or the access code described above

Access code is the md5 generated based on the access key + route, eg:

Access key	Route	Generating access code	Access code
ILoveRSSHub	/qdaily/column/59	md5('/qdaily/column/59' + 'ILoveRSSHub')	0f820530128805ffc10351f22b5fd121

- Routes are accessible via `code`, eg: `https://rsshub.app/qdaily/column/59?code=0f820530128805ffc10351f22b5fd121`
- Or using `key` directly, eg: `https://rsshub.app/qdaily/column/59?key=ILoveRSSHub`

Healthcheck Configuration

When `ACCESS_KEY` is enabled, the `healthcheck` endpoint also requires authentication.

For a Docker Compose deployment, you'll need to update the `healthcheck` configuration in your `docker-compose.yml` to include the access key or access code parameter.

The recommended configuration is:

```
healthcheck:
 -  test: ["CMD", "curl", "-f", "http://localhost:1200/healthz"]
 +  test: ["CMD", "curl", "-f", "http://localhost:1200/healthz?key=${ACCESS_KEY}"]
```
